# PHYS341: Quantum Mechanics Fall 2006

| Teacher: Dr. Kelly Krieble                | Classroom: CHS 123 M,W,F 11:30 - 12:20 |  |
|---|--|--|
| Office: Room 109, Collier Hall of Science | CHS 124 Th 9:0010:00                   |  |
| Phone: ext. 1437                          | Lab: CHS 107 Th 12:453:45              |  |
| e-mail: krieblek@moravian.edu             | Office Hours: By appointment           |  |

### Goals of the course:

The primary aim of this course is to provide students with a working knowledge of the concepts of quantum mechanics and to prepare them for graduate school or industry. In the laboratory portion of the course, the students will learn a variety of experimental techniques that will complement the theoretical ideas introduced throughout the course.

**Course Text:** Introduction to Quantum Mechanics, 2nd ed., Griffiths.

### **Course Content and Schedule of Topics:**

| Торіс                                    | Approximate Time Span | Readings  |
|--|-----------------------|-----------|
| 1. The Wave Function                     | 2 weeks               | Chapter 1 |
| a. Probability                           |                       |           |
| b. Normalization                         |                       |           |
| c. Fourier Series                        |                       |           |
| d. Observables                           |                       |           |
| 2. The Schrodinger Equation              | 4 weeks               | Chapter 2 |
| a. Superposition                         |                       |           |
| b. Separation of Variables               |                       |           |
| c. Examples:                             |                       |           |
| i. Infinite Well                         |                       |           |
| ii. Harmonic Oscillator                  |                       |           |
| (1) Algebraic Methods                    |                       |           |
| (2) Raising and Lowering Operators       |                       |           |
| (3) Recursion                            |                       |           |
| (4) Hermite Polynomials                  |                       |           |
| iii. Free Particle                       |                       |           |
| iv. Delta Function Potential             |                       |           |
| v. Finite Square Well                    |                       |           |
| (1) Barriers                             |                       |           |
| (2) Tunneling                            |                       |           |
| 3. Vector Spaces                         | 3 weeks               | Chapter 3 |
| a. Eigenvalues and Eigenfunctions        |                       |           |
| b. Operators                             |                       |           |
| c. Uncertainty Principle                 |                       |           |
| d. Dirac Notation                        |                       |           |
| e. Matirx Theory                         |                       |           |
| 4. 3D Quantum Mechanics                  | 3 weeks               | Chapter 4 |
| a. Coordinate Systems                    |                       |           |
| b. Hydrogen Atom                         |                       |           |
| c. Angular Momentum                      |                       |           |
| d. Spin                                  |                       | -         |
| 5. Perturbation Theory                   | 2 weeks               | Chapter 6 |
| a. Time Independence                     |                       |           |
| b. Degeneracy                            |                       |           |
| c. Fine Structure                        |                       |           |
| d. Zeeman Effect and Hyperfine Splitting |                       |           |

#### Grading Policy:

- A = 90%-100%
- B = 80%-89%
- C = 70%-79%
- D = 60%-69%
- F = below 60%

| Assessment:       | % Weight |
|-------------------|----------|
| Homework Problems | 30       |
| Lab Project       | 30       |
| Exams             | 20       |
| Final Exam        | 20       |

#### **Homework Problems:**

As illustrated above, the problem sets constitute a major portion of your grade. Your work on these problem sets will be bound by the Moravian College Policy on Academic Honesty in the Student Handbook. The due dates for each assignment will be stated when the assignment is handed out. There will be a 50% deduction for tardy work up until solutions to the homework are posted. Work submitted after that time will receive a zero.

## Lab Project:

The lab project for this course will comprise a semester-long examination of a particular advanced physics topic. You will have the opportunity at the beginning of the semester to select a topic that you will research. Your options include but are not limited to:

- 1. Mossbauer Spectroscopy.
- 2. Beta Ray spectrum.
- 3. Faraday Effect.
- 4. Zeeman Effect
- 5. Stirling Engine.
- 6. Particle Scattering.
- 7. Cloud Chamber.
- 8. Magneto-Optic Kerr Effect.
- 9. NMR.
- 10. Hydraulic Jump
- 11. Granular Flow.
- 12. Raman Spectroscopy
- 13. Open Cavity Laser

Assessment for the lab project will include a formal lab report (20%), a poster (5%), and a presentation (5%)

# Exams:

Approximately two to three in-class exams will be given during the semester.

# Final comprehensive exam:

An exam on all material covered during the semester.

### **Attendance Policy:**

Students are expected to come to class. To that end, I WILL take attendance, and reserve the right to raise/lower your grade based on your attendance.

Good luck in the coming year. Should you have any comments about the class during the semester, please feel free to discuss them. I will welcome any suggestions for improving the course. Since I am looking for you to do your best work, you should demand excellence from me as well.
